

psi46 x-ray trimming attempts

Marco Rossini

Institute for Particle Physics, ETH Zürich

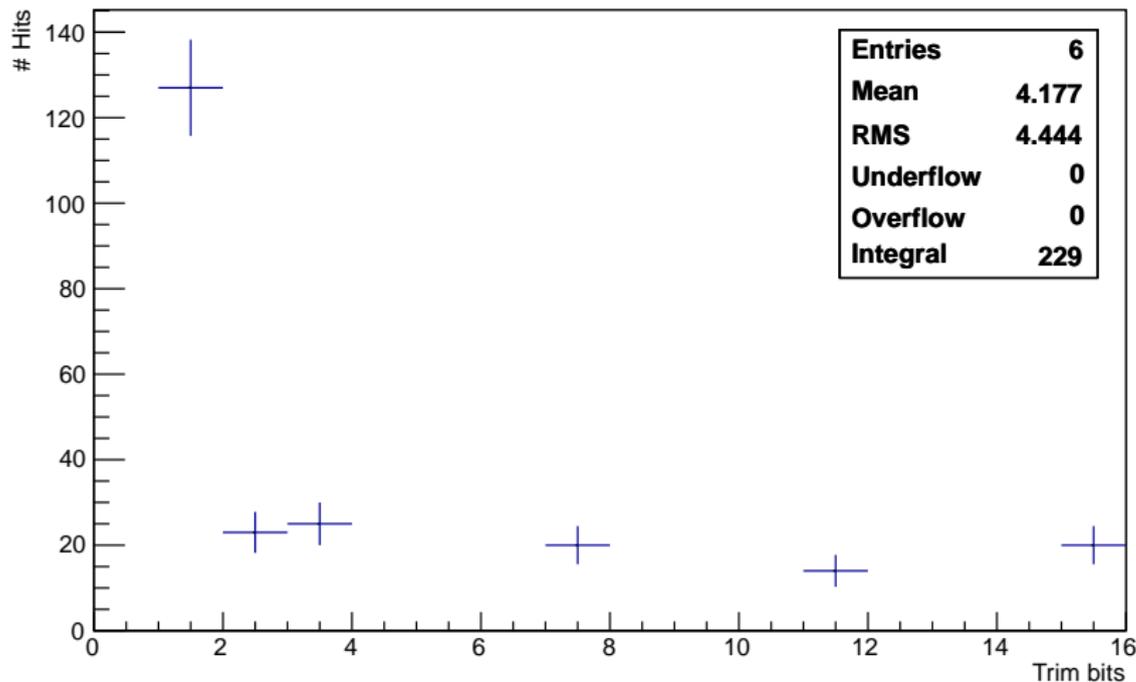

5. December 2011

Algorithm 1

1. Set $V_{trim} = 130$
2. Set Trim bits = 15
3. Search and set highest possible V_cThr (here: 119) (– safety margin)
4. Lower the trim bits of pixels until they (each) reach breakdown, one row at a time. Fix lowest trimbits (+ safety margin).

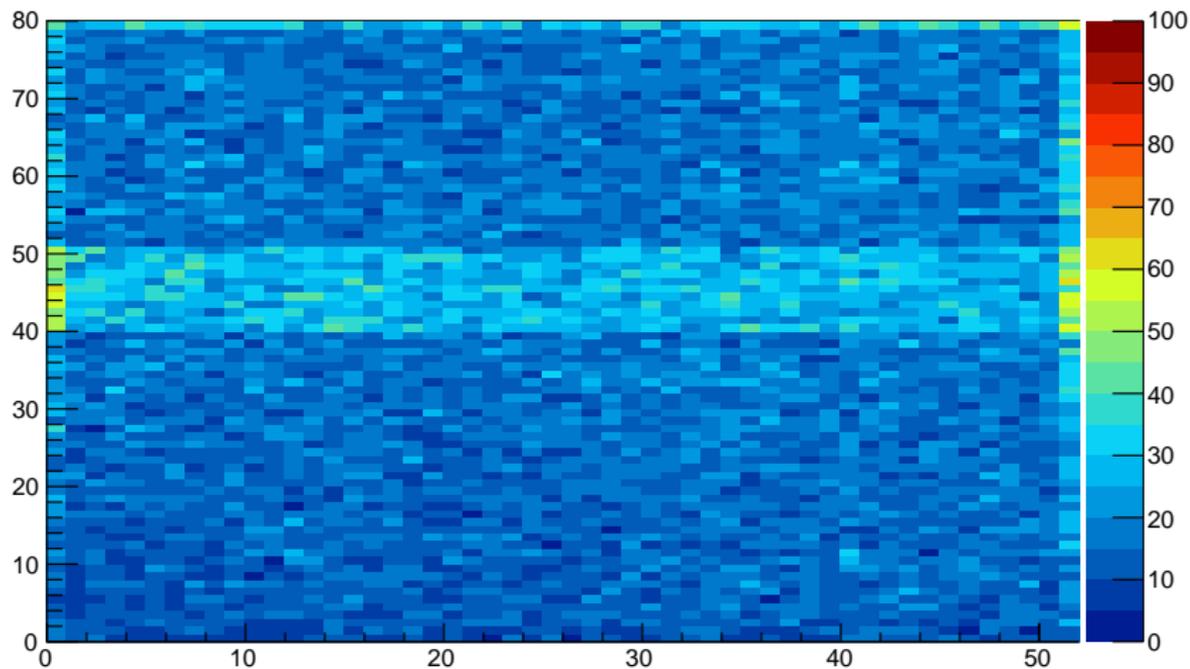

Algorithm 1

Trim bit scan, single pixel hits

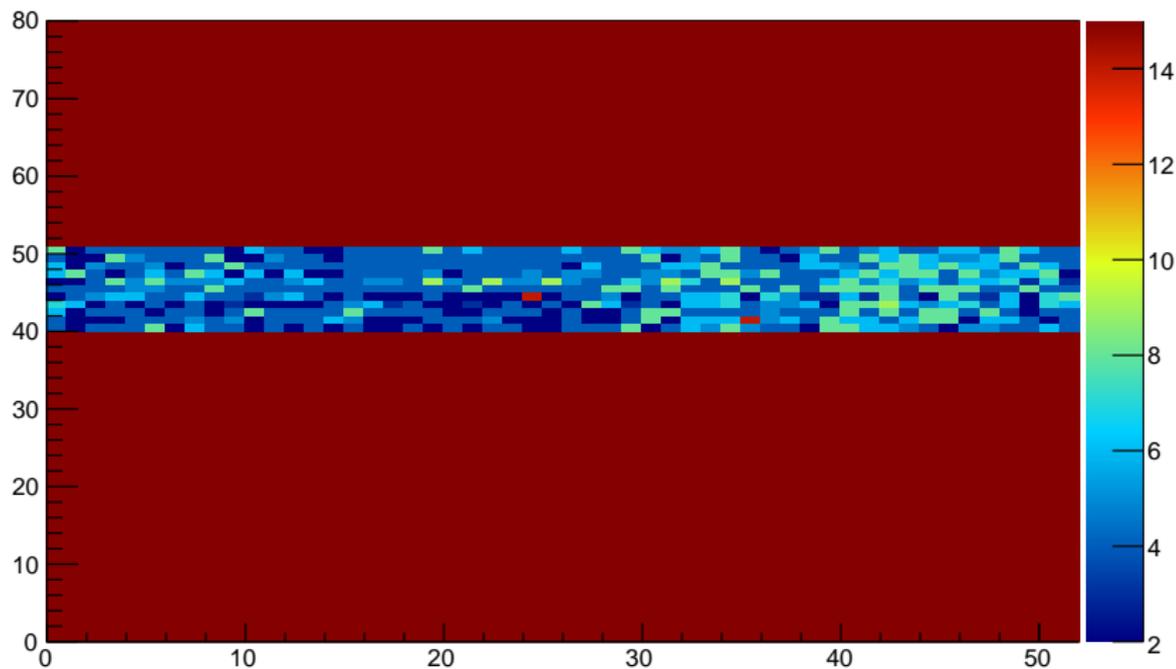

Algorithm 1

Pixelmap trimmed

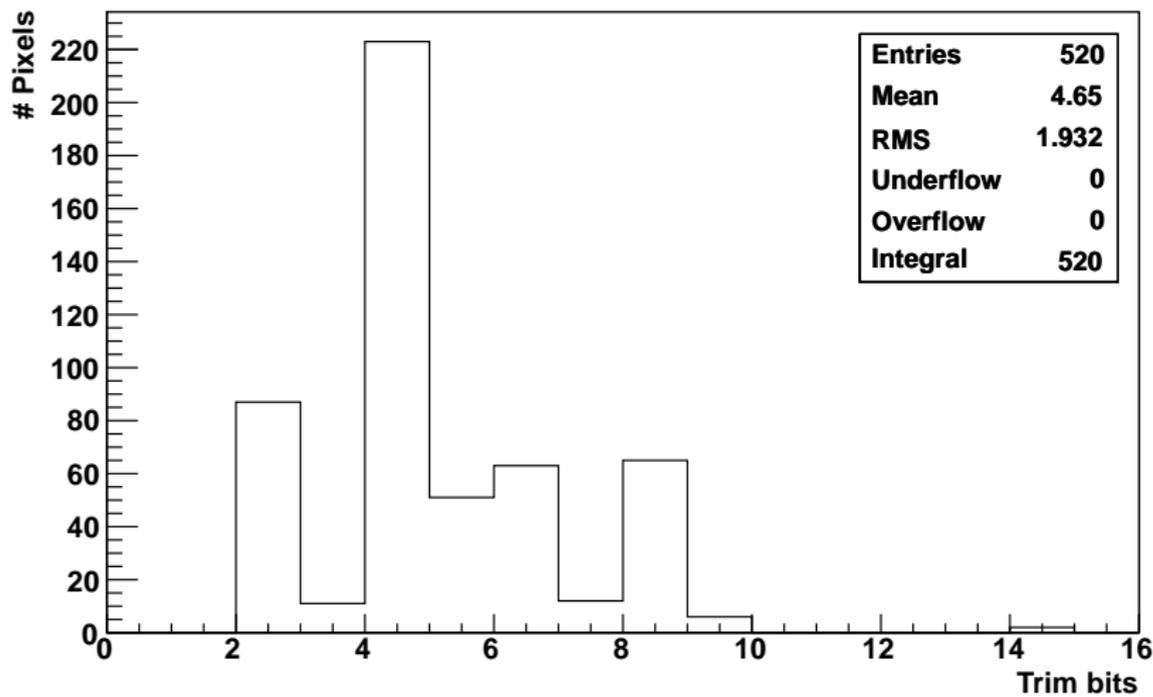

Algorithm 1

TrimMap_C0

Algorithm 1

Trim bit distribution

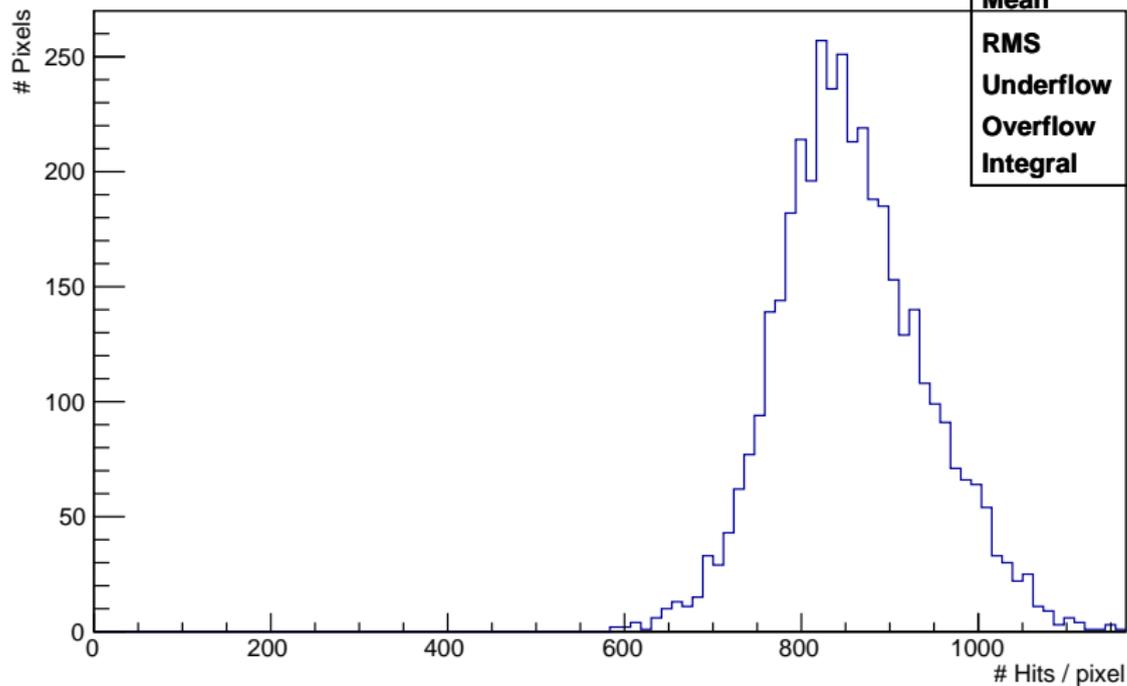

Algorithm 2

1. Set $V_{\text{trim}} = 130$
2. Set trim bits = 0
3. Search highest possible threshold
4. Take 10 % of pixels with most hits, increase their trim bit by 1
5. Goto 3

Algorithm 2

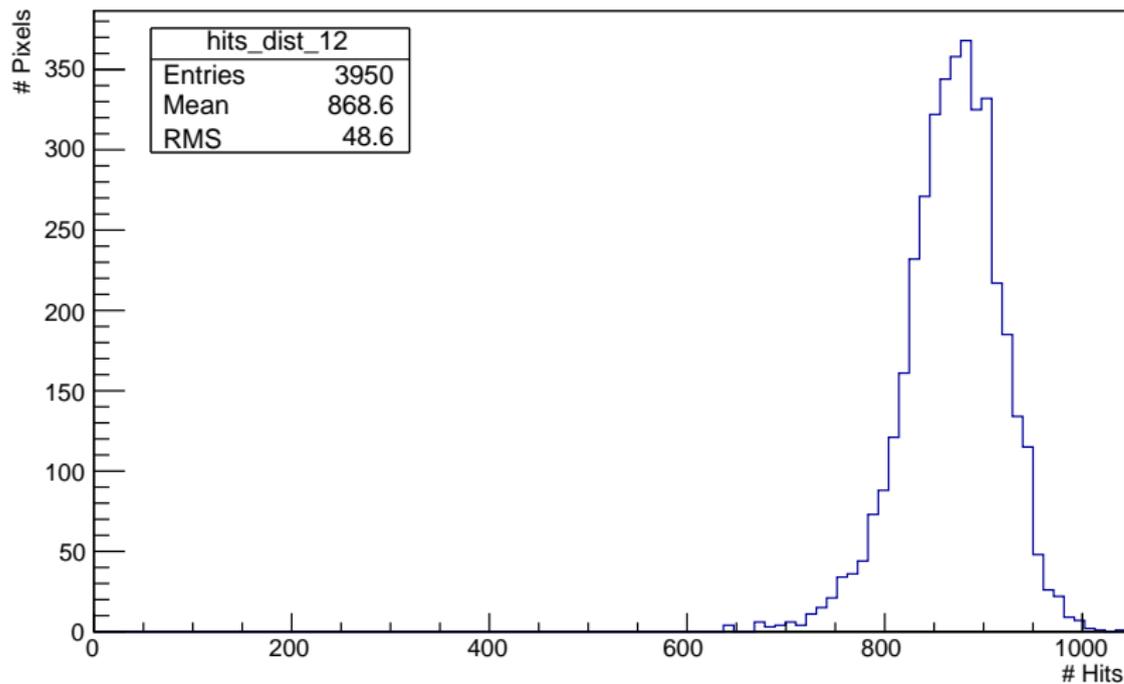

Hits distribution (iteration 0)

Entries	3950
Mean	856.7
RMS	83.46
Underflow	0
Overflow	0
Integral	3950

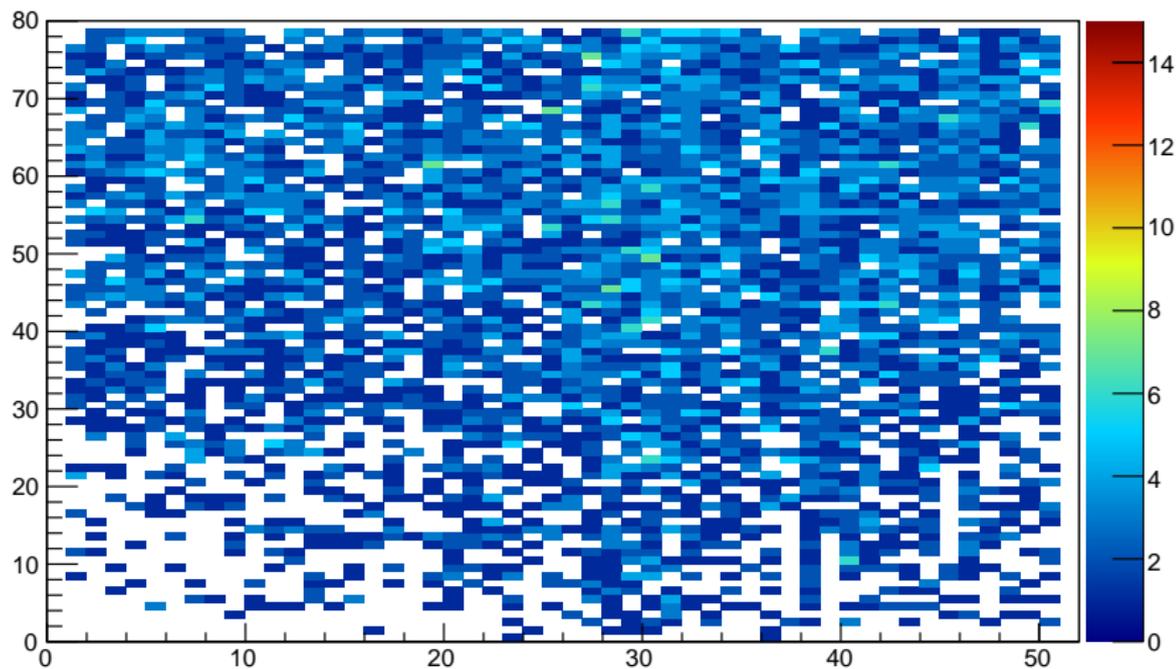

Algorithm 2

Hits distribution (iteration 12)

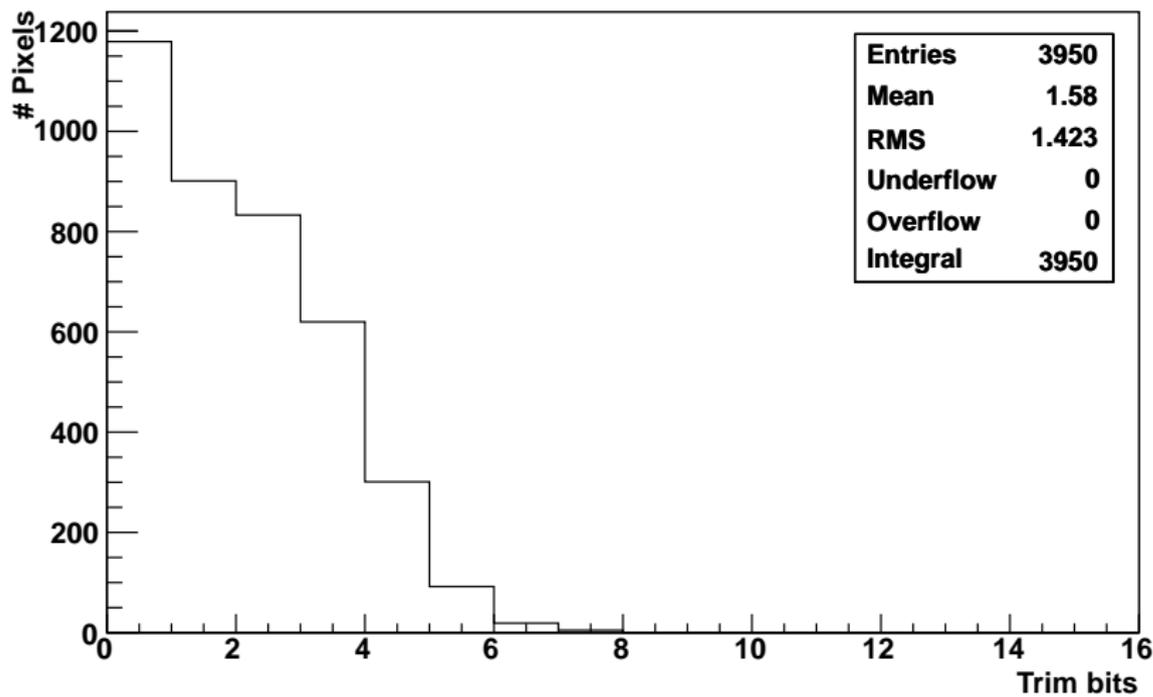

Algorithm 2

Trim bits

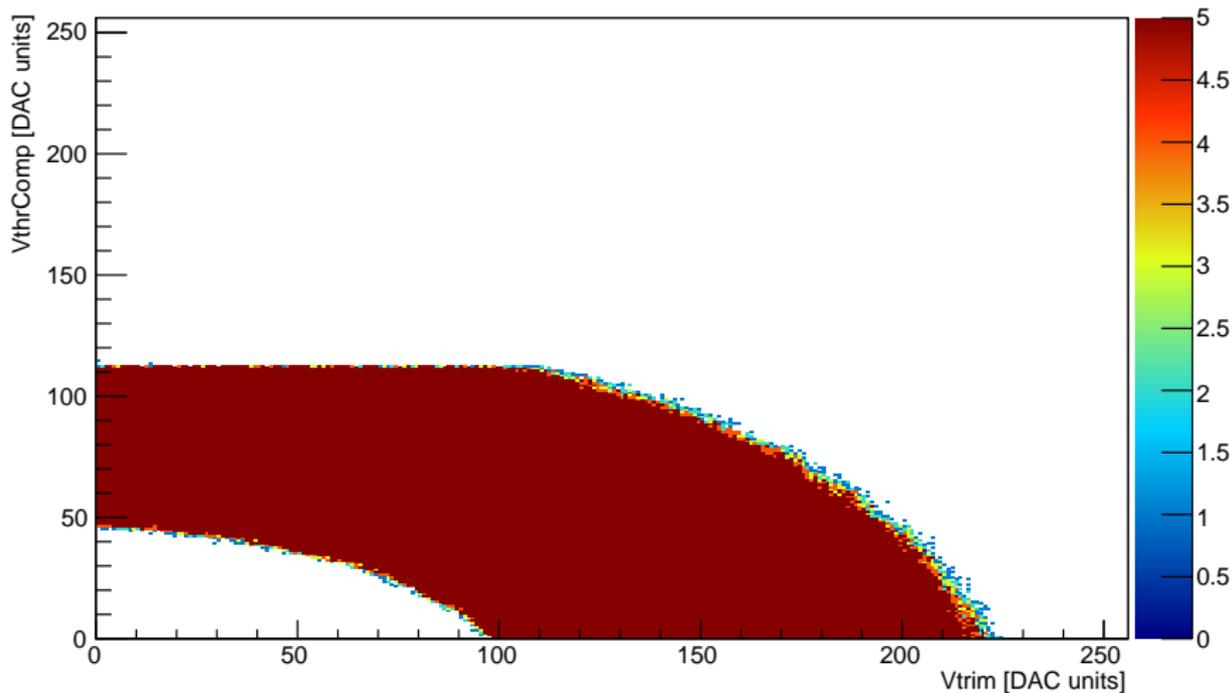

Algorithm 2

Trim bit distribution
