Cooling Box

Felix Bachmair, Mauro Donegà, Philipp Eller, Marco Rossini,
Andrey Starodumov, Rainer Wallny

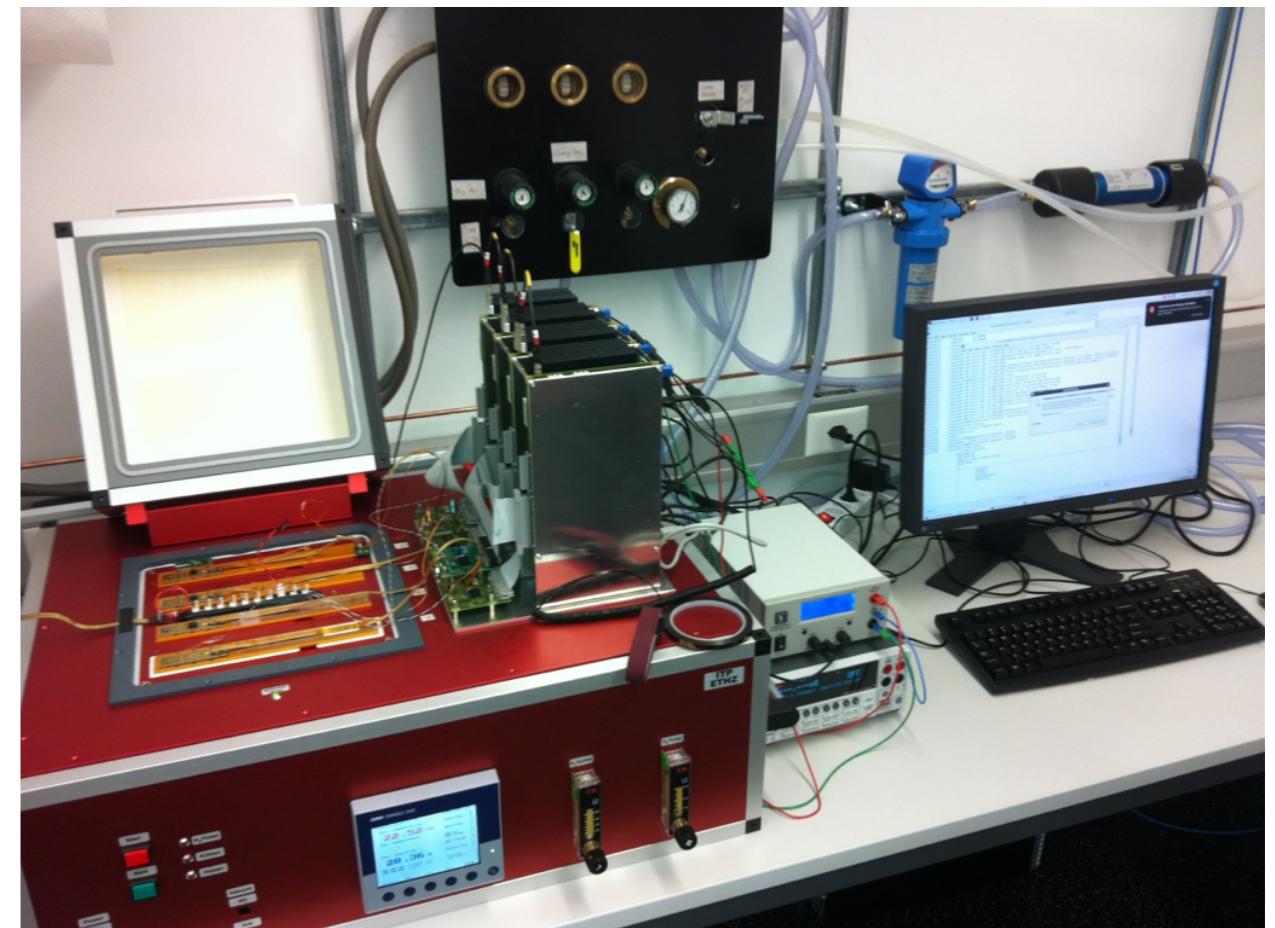

Cooling Box

used to thermal cycle Modules for qualification and testing

Requirements

- temp. range: [-20,30] °C
- low humidity (0(few %))
- fast cycling
- vacuum to fix modules and improve thermal conductivity
- test several Modules in parallel
- thermal stability (+/- 1 °C around set point temperature)
- controllable by computer

current design based on the PSI version

key features:

- Active cooling and heating by Peltier elements
- Possible to operate 4 Lines (Modules with Testboards) in parallel.
- Tests at -10 °C at +17 °C

PAUL SCHERRER INSTITUT
PSI

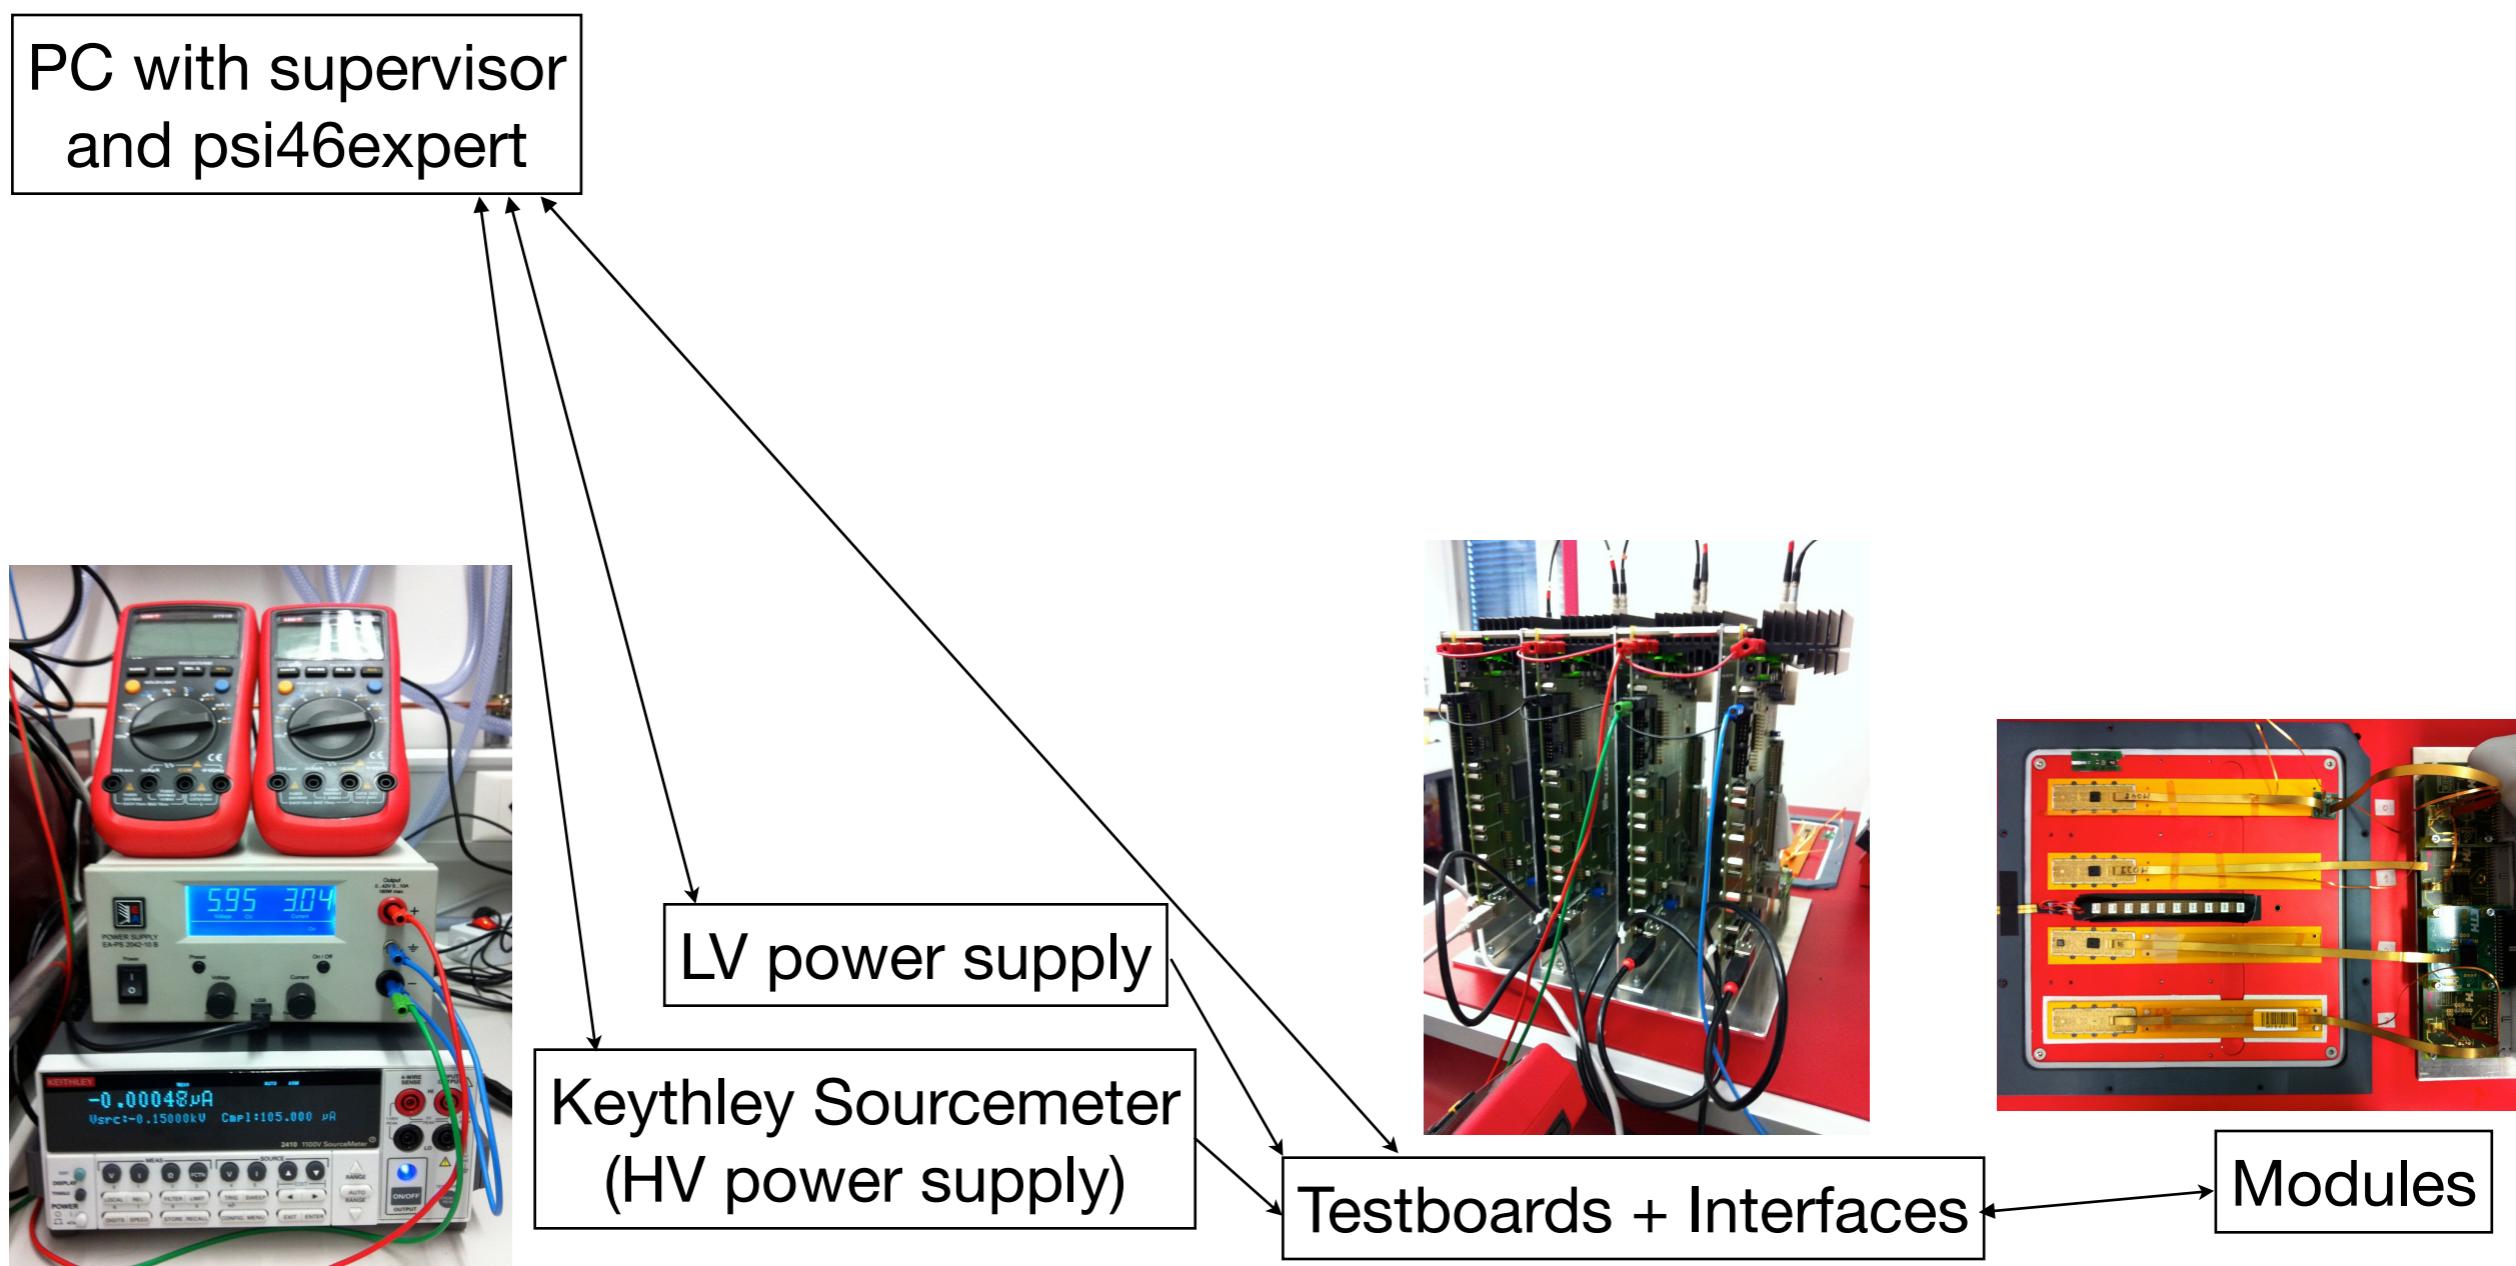

Changes made with respect to the PSI Version:

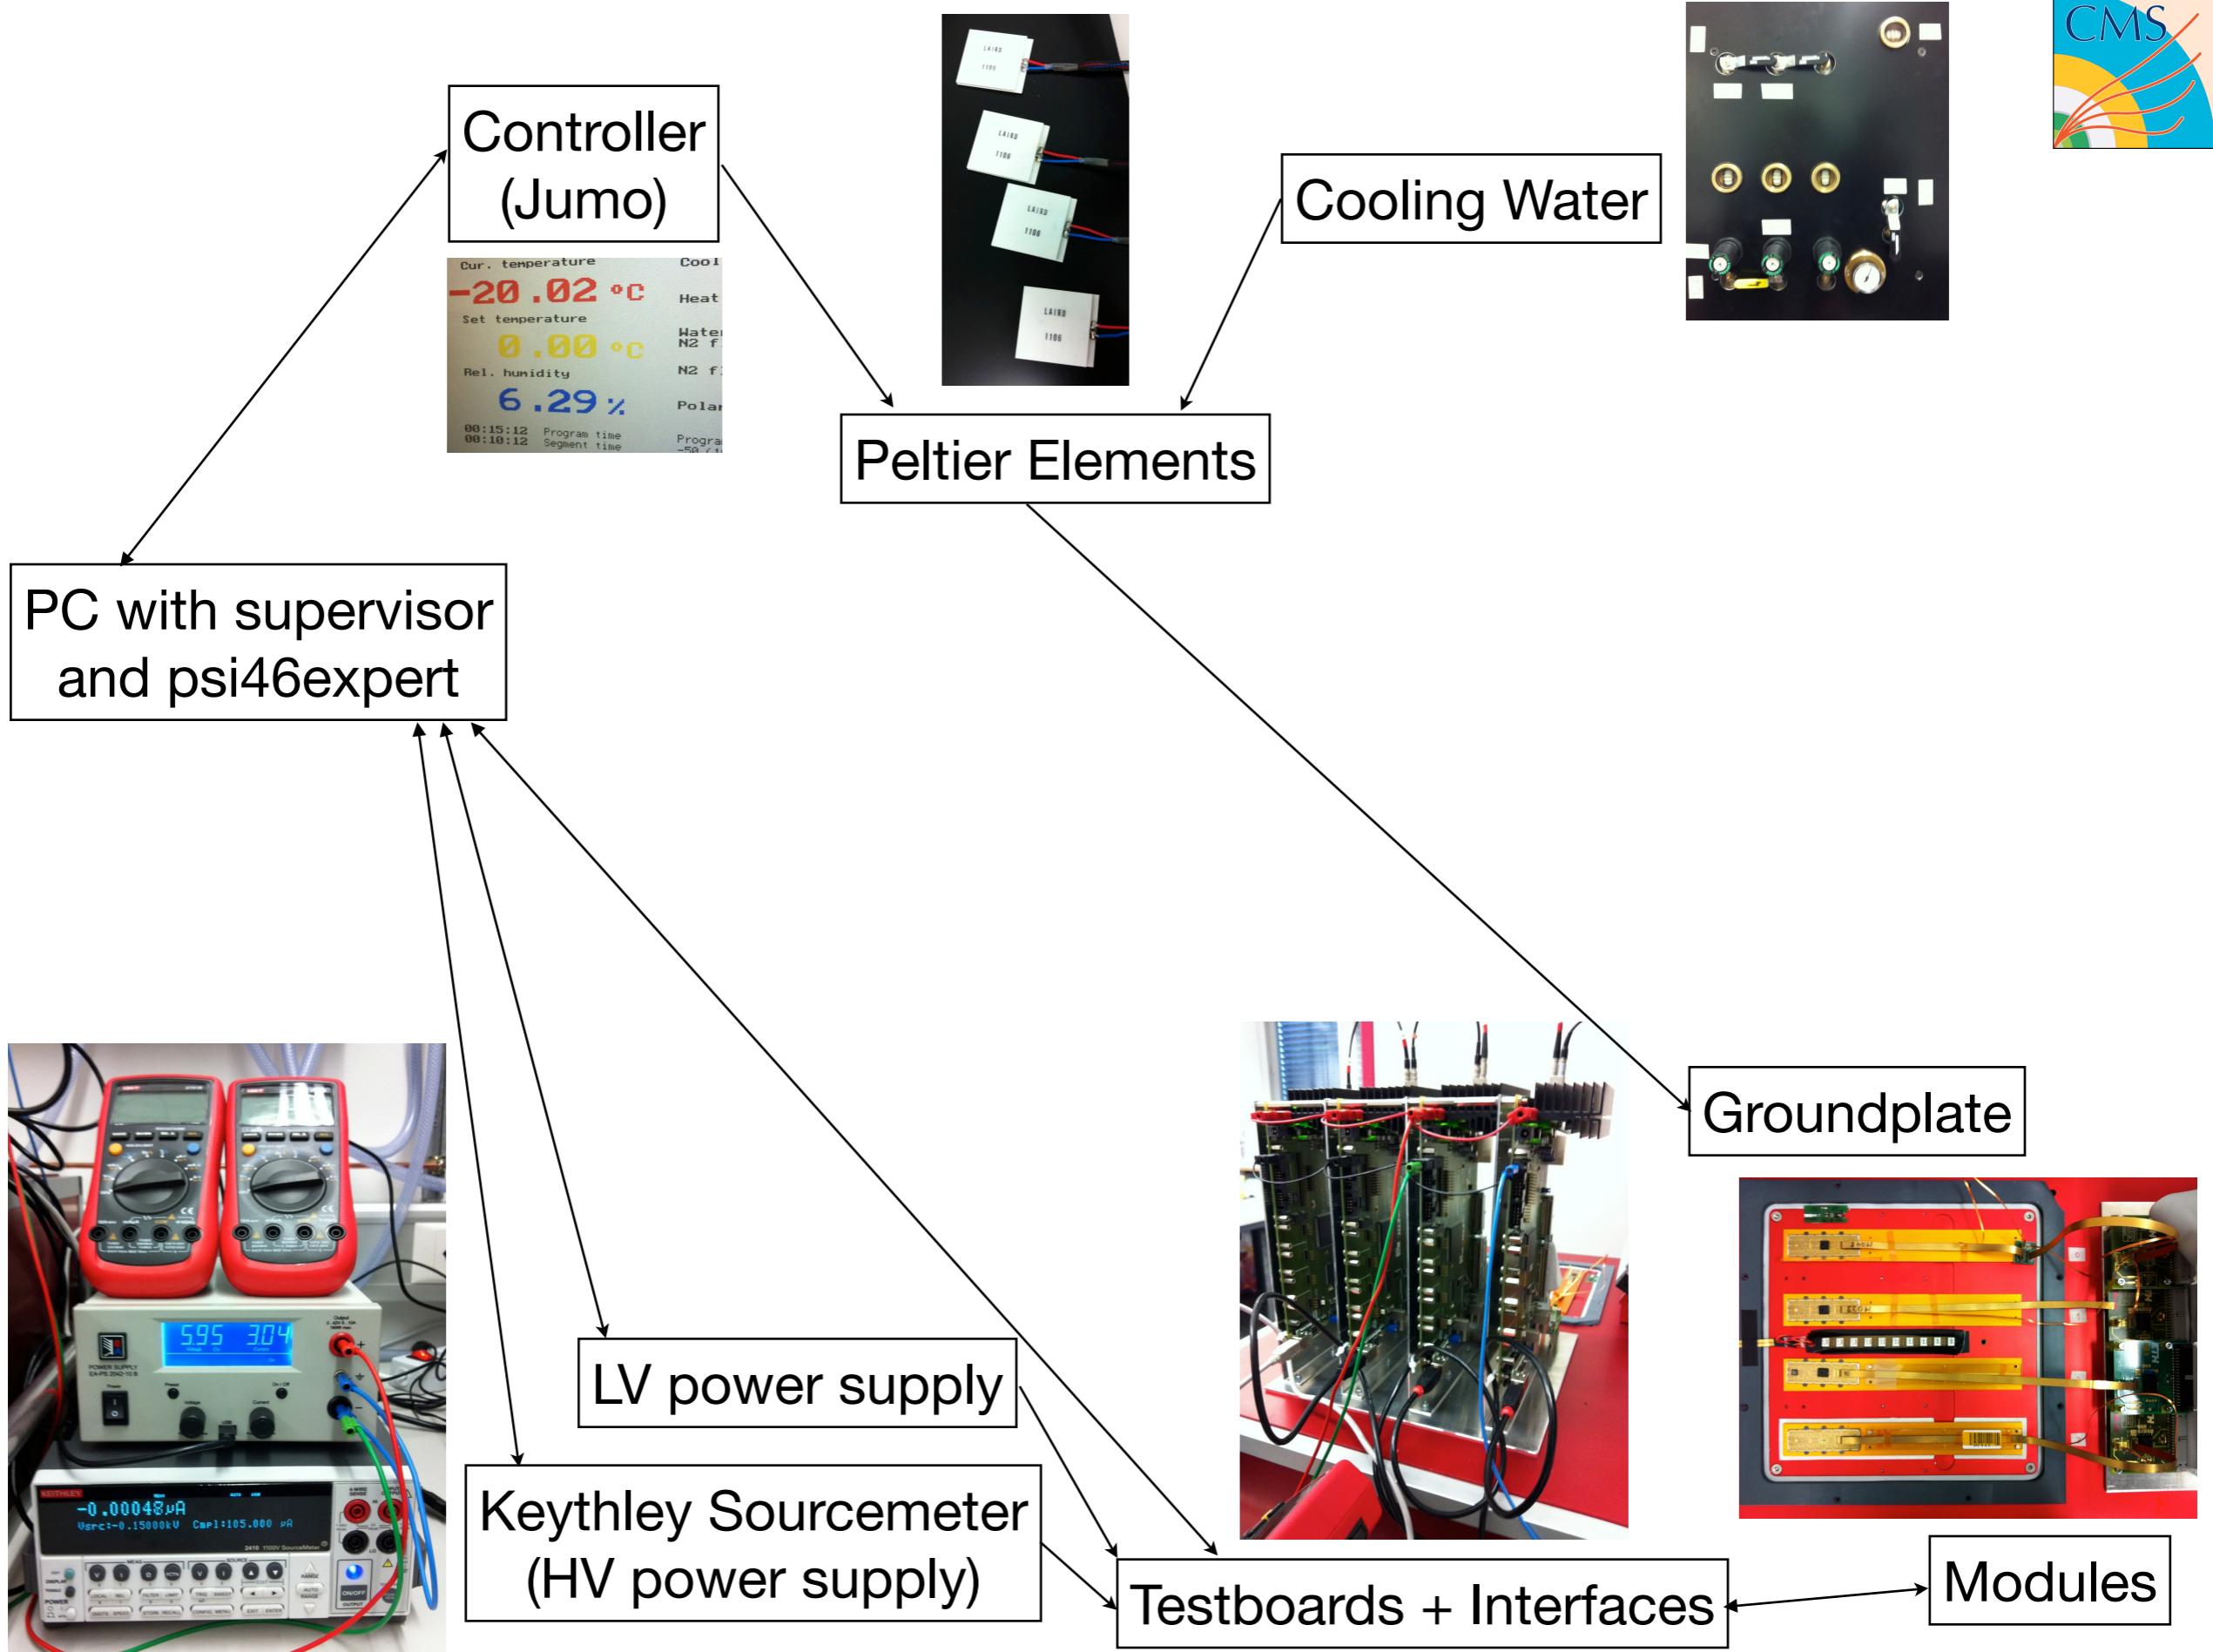

- higher cooling power (ca. 830 W)
- higher cooling water flow rate
- improved vacuum flow path
- module holder problem (Flatness)
- thermal conductivity foil
- extended Isolation
- dry air (instead of flow limited N₂)

Example

Temperature in CoolingBox ETH

Control Procedure, that runs the full testing software:

- psi46expert
- temperature control
- HV control (IV curves)
- error handling
- test evaluation
- web upload to database

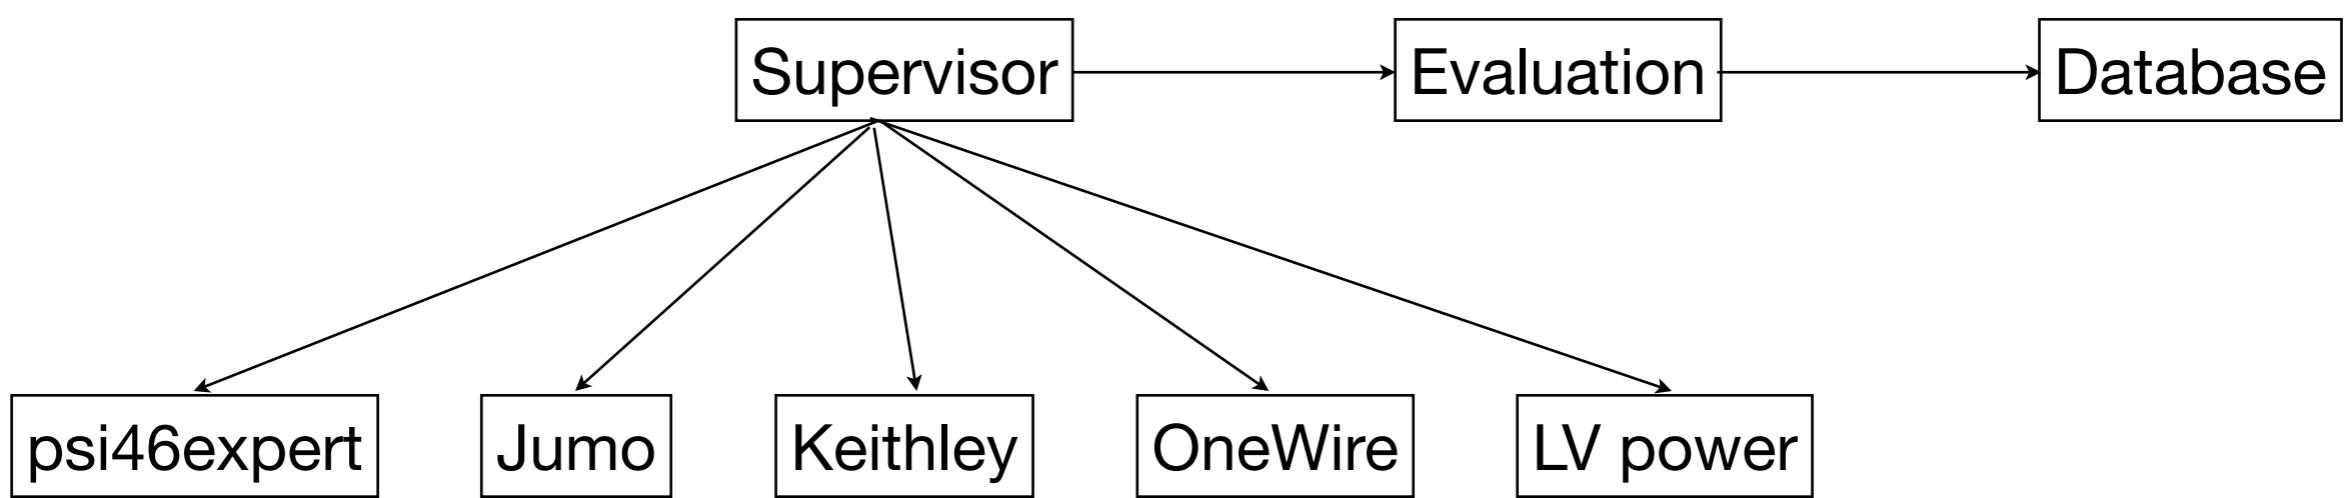

Problems with existing Version:

- change of OS (SL4->SL5)
- change of hardware

new Version for ETH under development

Plan

- retest existing Modules at PSI
(from Pilot setup and other remaining Modules)
- retest the same Modules at ETH
(consistency check and transportation rehearsal)

Extension of Signal and Power cable to test Modules with shortened cables
(from Pilot setup at PSI)

- test ROCs (and Modules) with the new ROC design

holders for new ROC PCB for mounting in coolingbox
